How to use 9 my Poker Variance

Calculator?

This section will explain how the calculator works and what the numbers and charts mean.

Enter the data 9 Settings Hop over to the Variance Calculator page and enter your win rate, standard deviation, and the number of hands 9 you want to simulate. You can ignore the field observed win rate, we'll get to its purpose later. Once you 9 have entered the data, hit Calculate and let the Calculator do its magic.

Twenty samples

Variance Calculator Samples The first thing 9 the Variance Calculator does is to run 20 samples over the number of hands, win rate and standard deviation specified. 9 It'll also calculate the expected winnings over the number of hands. This number will appear as a rather boring straight 9 and black line in the graph. Thirdly the calculator displays the 70% and 95% confidence intervals as light and dark 9 green curves. What you need to know

about them is that at any given time your winnings will be within 9 these intervals with a probability of 70% and 95% respectively. They basically show, how much variance you should expect to 9 see.

Variance in numbers

Below the first chart, the Variance

Calculator compiles a neat list of additional information:

EV : win rate entered

9 above

: win rate entered above Standard deviation : standard deviation entered above

:

standard deviation entered above Hands : number of 9 hands entered above

: number of

hands entered above Expected winnings : estimated winnings over the simulated amount of hands

: estimated 9 winnings over the simulated amount of hands Standard deviation after

X hands : This number shows how much your actual 9 results will differ from the expected results on average. The first number shows the absolute value and the second translates 9 this number into BB/100, showing the impact on your win rate.

: This number shows how

much your actual results will 9 differ from the expected results on average. The first number shows the absolute value and the second translates this number 9 into BB/100, showing the impact on your win rate. 70% confidence interval : Your actual results over the simulated amount 9 of hands will be within this interval 70% of the time. The first interval shows absolute numbers and the second 9 translates those into BB/100, showing the 70% confidence interval for your win rate.

: Your actual results over the simulated

amount 9 of hands will be within this interval 70% of the time. The first interval shows absolute numbers and the second 9 translates those into BB/100, showing the 70% confidence interval for your win rate. 95% confidence interval : Same as the 9 above with 95% certainty. Meaning: 19 out of 20 times your actual winnings will be within this interval.

: Same as 9 the above with 95% certainty. Meaning: 19 out of 20 times your actual winnings will be within this interval. Probability 9 of loss after X hands : the probability that you will experience negative winnings (meaning: losses) over the number of 9 hands.

: the probability that you will experience negative winnings (meaning: losses) over the number of hands. Probability of running at 9 or above observed win rate ... : If you entered an observed win rate, this number will show you the 9 probability that you will experience a run at or above this win rate over the number of hands.

: If you

9 entered an observed win rate, this number will show you the probability that you will experience a run at or 9 above this win rate over the number of hands. Probability of running below observed win rate ... : Same as 9 above – the probability that you will experience a run below the observed win rate over the number of hands.

: 9 Same as above

– the probability that you will experience a run below the observed win rate over the number 9 of hands. Minimum bankroll for less than 5% risk of ruin: the bankroll needed to have a risk of ruin 9 of less than 5%

Detailed sample with downswing

Variance Calculator

Downswing Samples

This chart simulates a single run over 100 thousand up to 9 10 million

hands with the win rate and standard deviation entered above. You can choose how many

hands to simulate 9 by moving the slider.

Apart from showing a single sample, this graph

also shows some insightful information about downswings. The red 9 area shows for any given point, how much the sample is currently away from its previous peak, meaning it tracks 9 downswings. This chart uses two vertical axes. While the sample winnings have their scale on the right axis, the downswing 9 tracker has its scale on the left axis. In this example, the simulated player ended up with winnings over 25,000 9 big blinds after 2.5 million hands but had to deal with a nasty downswing of almost 10,000 big blinds between 9 hand 1.2 million and hand 2 million.

Downswings in numbers

The last section of

the Variance Calculator sheds some more light on 9 potential downswings. Therefore 100 million hands are simulated and all downswings over this simulation are tracked. The first table shows 9 the extent of the downswings. It shows how often the simulated player was stuck in a downswing of at least 9 X big blinds. For example (1000+ BB – 31.77%) means the player was in the middle of a downswing of 9 at least 1,000 big blinds 31.77 percent of the time.

The second table shows how long downswings last on average. For

9 example (50000+ Hands – 15.81%) means the simulated player was in a downswing over at least 50,000 hands 15.81 percent 9 of the time. For the purpose of these calculations, a downswing is defined as any period where the current total 9 winnings are below the maximum previous total winnings. Meaning, that by this definition a downswing is not over until the 9 player has fully recovered his losses.

In general, these simulations

underestimate the extent of downswings, but the numbers should still give 9 you a decent idea of the vastness of downswings you should expect.

Should you have any questions,

encounter any errors or 9 have ideas for improvements, please let me know.
