PC Card Slot Types

ISA

AGP

PCI

PCI-X

PCI-E (PCIexpress)

ISA

ISA, or Industry Standard

Architecture, is an 8bit or 16bit parallel bus system that allowed up to 6 devices to be connected to a PC. Virtually all IBM-compatible PCs made before the Pentium were based on the ISA (IBM's PC AT) bus. This asynchronous bus architecture uses 16-bit addresses and an 8-MHz clock and handles a maximum data throughput of 2 MB/s to 3 MB/s.

ISA is the precursor to PCI. Standing for "Industry Standard Architecture" It was common from the early 1980s to the mid 1990s. ISA was a typically inelegant solution for the time, and required one to know exactly what one was doing- PnP was rare, even for so called "ISA PnP" peripherals. In the end, the combination of flexibility, ease of use, and greater capability allowed PCI to supersede ISA.

PCI

The PCI bus

architecture is a processor-independent bus specification that allows peripherals to access system memory directly without using the CPU. Not only does this free up the CPU to service other application calls, but PCI users also can simultaneously acquire data to memory and analyze existing data in real time, all while communicating with other functions on the network.

More importantly, PCI peripherals running asynchronously can send data along the 32-bit bus at a rate of up to 132 MB/s or 66 MS/s.

AGP

The

Accelerates Graphics Port is a high-speed point-to-point channel for attaching a video card to a computer's motherboard. It was created in 1997 yet by 2004 was largely replaced by PCI Express. The primary advantage of AGP over PCI is that it provides a dedicated pathway between the slot and the processor rather than sharing the PCI bus.

In addition to a lack of contention for the bus, the point-to-point connection allows for higher clock speeds. AGP also uses sideband addressing, meaning that the address and data buses are separated so the entire packet does not need to be read to get addressing information. This is done by adding eight extra 8-bit buses which allow the graphics controller to issue new AGP requests and commands at the same time with other AGP data flowing via the main 32 address/data (AD) lines. This results in improved overall AGP data throughput.

PCI-X

PCI-X stands for "PCI-eXtended". PCI-X is a computer bus and expansion card standard that enhances the 32-bit PCI Local Bus for higher bandwidth demanded by servers. It is a double-wide version of PCI, running at up to four times the clock speed, but is otherwise similar in electrical implementation and uses the same protocol.[1] It has itself been replaced in modern designs by the similar-sounding PCI Express, which features a very different logical design, most notably being a "narrow but fast" serial connection instead of a "wide but slow" parallel connection.

PCI-X revised the conventional PCI standard by doubling the maximum clock speed (from 66 MHz to 133 MHz)[1] and hence the amount of data exchanged between the computer processor and peripherals. Conventional PCI supports up to 64 bits at 66 MHz (though anything above 32 bits at 33 MHz is only seen in high-end systems) and additional bus standards move 32 bits at 66 MHz or 64 bits at 33 MHz. The theoretical maximum amount of data exchanged between the processor and peripherals with PCI-X is 1.06 GB/s, compared to 133 MB/s with standard PCI. PCI-X also improves the fault tolerance of PCI allowing, for example, faulty cards to be reinitialized or taken offline.

PCI Express

PCIe, or Peripheral Component Interconnect Express, is a computer expansion card standard designed to replace the older PCI, PCI-X, and AGP standards. PCI Express is used in consumer, server, and industrial applications, as a motherboard-level interconnect (to link motherboard-mounted peripherals) and as an expansion card interface for add-in boards. A key difference between PCIe and earlier buses is a topology based on point-to-point serial links, rather than a shared parallel bus architecture.

Bandwidth

Below is a table showing the different buses/card slot types and their maximum bandwidths:

PCI	132 MB/s	AGP 8X	2,100 MB/s	PCI Express 1x	250																
[500]*	MB/s	PCI Express 2x	500	[1000]*	MB/s	PCI Express 4x	1000	[2000]*	MB/s	PCI Express 8x	2000	[4000]*	MB/s	PCI Express 16x	4000	[8000]*	MB/s	PCI Express 32x	8000	[16000]*	MB/s
USB 2.0 (Max Possible)	60 MB/s	IDE (ATA100)	100 MB/s	IDE (ATA133)	133 MB/s	SATA	150 MB/s	SATA II	300 MB/s	Gigabit Ethernet	125 MB/s	IEEE1394B [Firewire 800]	~100 MB/s*								

* Note - Since PCI Express is a serial based technology, data can be sent over the bus in two directions at once. Normal PCI is Parallel, and as such all data goes in one direction around the loop.

¡Hola, lectoras e lectores del sitio! Hoy, gustaría de presentar a la plataforma de casino online e apuestas deportivas B Bets. Con promociones generosas, juegos emocionantes y una interfaz intuitiva, B Bets está rápidamente se tornando una de las mejores casas de apuestas online. B Bets es un sitio que ofrece entretenimiento y diversión para sus clientes, con una variedad de juegos de casino e apuestas deportivas betano betano eventos nacionales e internacionales. Una de las ventajas de registrarse en B Bets es para los usuarios poder aprovechar promociones betano betano dinero y free spins, además de una amplia variedad de juegos de casino e apuestas deportivas. Además de eso, la interfaz es fácil de usar y ofrece pago seguro y confiable. Sin embargo, es importante recordar algunas precauciones al usar B Bets, como jugar solo por diversión, fijar un límite de dinero antes de jugar e nunca proporcionar información personal o bancaria por correo electrónico o mensaje. Vale resaltar que la empresa utiliza tecnologías avanzadas para proteger la información de los usuarios y garantizar el juego justo. En resumen, B Bets es una plataforma moderna y atractiva para aquellos que desean jugar online con seguridad y confianza. Con sus ofertas promocionales y variedad de juegos, es definitivamente una opción a ser considerada. No pierda la oportunidad de divertirse y ganar emocionantes premios!

Militares se reúnen frente al Palacio Presidencial en Bolivia: presidente Luis Arce

El miércoles, miembros de las fuerzas militares de Bolivia se reunieron frente al Palacio Presidencial, según informó el presidente de Bolivia, Luis Arce, a través de la plataforma de redes sociales X. Esto parecía ser un intento de un general de tomar el edificio gubernamental.

Evo Morales afirma que se está llevando a cabo un "golpe de Estado"

El expresidente Evo Morales afirmó que un "golpe de Estado" estaba en curso.

"En este momento, el personal de las Fuerzas Armadas y tanques están desplegados en la Plaza Murillo", dijo en las redes sociales. "Hagamos un llamado a los movimientos sociales del campo y la ciudad para defender la democracia".

El general Juan José Zúñiga afirma que el ejército, la fuerza aérea y la marina están "movilizados"

El general Juan José Zúñiga, que se paraba en el umbral del palacio por la tarde y estaba rodeado de miembros de las fuerzas armadas, afirmó que el ejército, la fuerza aérea y la marina de Bolivia estaban "movilizados".

"También está con nosotros la fuerza policial", dijo en La Paz, la capital administrativa del país.

Ministros se reúnen mientras la milicia llega

Los ministros se reunían cuando llegaron las fuerzas militares. El Sr. Arce, un izquierdista y sucesor designado del Sr. Morales, condenó los esfuerzos en X.

"La democracia debe ser respetada", dijo. Inicialmente no estaba claro si el Sr. Arce estaba en el palacio.

Los medios de comunicación locales habían informado de que el general Zuñiga había sido despedido de su cargo esta semana, lo que algunos en el país atribuyeron a los comentarios que hizo sobre el Sr. Morales.
